Group Assessment

Project Description and Goals: Our project explored the usefulness of graph databases compared to relational databases. Additionally, we told the history of graph databases, why they were created, and noted several use cases and applications. Our goal was to teach back to the class when and how to use graph databases. Overall, we believe we achieved our goal of teaching the class about graph databases by including several images to explain how graph databases look and how to query from them.

No specific data models were used to create the writeup other than a text editor.

For future work, we would like to delve more into Neo4j. We did cover it briefly in our presentation and paper, but a more in depth analysis of Neo4j and actually creating a graph database using it would be educational and informative.

Overall Reaction: We achieved our goals, but we know that we could've delved deeper into certain aspects of our project. Overall successful project!
